

Bird Of Prey Antenna Shields

When concealing antennas, a lot of steps come into play, but the effects on the birds are often an afterthought. Depending on your location, you might want to consider birds of prey antenna shields. STEALTH's antenna shields protect the wildlife and of course, the site, by providing a deterrent for nesting birds of prey. The shield cabling is made from stainless steel and all other components are made from galvanized steel, ensuring that the product will stand the test of time. Benefits of these antenna shields include:

- Rapid installation and minimal cost.
- Ability to retrofit towers between nesting seasons for towers currently impacted.
(Applies to migratory birds of prey)
- Ability to install with little-added labor on new builds in areas prone to nesting.
- Designs that tie into the existing platform and also stand alone structures.

**Nesting platforms are also available for the deployment of wireless telecom sites in government designated bird sanctuary locations.*
